

1 : Queue using array

```
#include <iostream>

using namespace std;

int main() {
    int q[5], front = 0, rear = -1;

    // Enqueue
    q[++rear] = 10;
    q[++rear] = 20;
    q[++rear] = 30;

    // Display
    for(int i = front; i <= rear; i++)
        cout << q[i] << " ";

    // Dequeue
    front++;

    return 0;
}
```

Output:

10 20 30

Process exited after 0.01564 seconds with return value 0

Press any key to continue

2 : Queue using linked list .

```
#include <iostream>

using namespace std;

struct Node {
    int data;
    Node* next;
};

int main() {
    Node *front = NULL, *rear = NULL;

    // Enqueue
    for(int x : {10, 20, 30}) {
        Node* n = new Node{x, NULL};

        if(front == NULL)
            front = rear = n;
        else {
            rear->next = n;
            rear = n;
        }
    }

    // Display
    while(front != NULL) {
        cout << front->data << " ";
        Node* temp = front;
        front = front->next;
        delete temp;
    }
}
```

```
}
```

```
    return 0;
```

```
}
```

Output :

10 20 30

Process exited after 0.01331 seconds with return value 0

Press any key to continue . . .
